REPORT

UPON

FORESTRY.

PREPARED

UNDER THE DIRECTION OF THE COMMISSIONER OF AGRICULTURE, IN PURSUANCE OF AN ACT OF CONGRESS APPROVED AUGUST 15, 1876.

BY

54939

FRANKLIN B. HOUGH.

OF THE SMITHSONIAN INSTITUTION

WASHINGTON:
GOVERNMENT PRINTING OFFICE,
1878.

00054939

FORTY-FIFTH CONGRESS, SECOND SESSION.

Resolved by the House of Representatives (the Senate concurring), That there be printed 25,000 copies of the report upon forestry, transmitted by the President to Congress from the Commissioner of Agriculture on the 13th day of December last; 15,000 copies thereof for the use of the House of Representatives, 7,500 for the use of the Senate, and 2,500 copies for the Commissioner of Agriculture: *Provided, however*, That the total number of pages of said report shall not exceed six hundred and fifty.

Passed by the House of Representatives March 26, 1878.

Passed by the Senate April 4, 1878.

To the House of Representatives:

I transmit herewith a special report upon the subject of Forestry by the Commissioner of Agriculture, with the accompanying documents.

R. B. HAYES.

EXECUTIVE MANSION,
December 13, 1877.

DEPARTMENT OF AGRICULTURE,
Washington, D. C., December 13, 1877.

SIR: By the provisions of "An act making appropriations for the legislative, executive, and judicial expenses of the government for the year ending June 30, 1877, and for other purposes," approved August 15, 1876, the Commissioner of Agriculture was required to appoint some man of approved attainments, and practically well acquainted with the methods of statistical inquiry, with a view of ascertaining the annual amount of consumption, importation, and exportation of timber and other forest products; the probable supply for future wants; the means best adapted to the preservation and renewal of forests; the influence of forests upon climate; and the measures that have been successfully applied in various countries for the preservation and restoration or planting of forests; and to report upon the same to the Commissioner of Agriculture, to be by him transmitted in a special report to Congress.

On the 30th of August, 1876, Hon. Frederick Watts, then Commissioner of Agriculture, appointed Dr. Franklin B. Hough, of Lowville, Lewis County, New York, to the discharge of this important duty.

Dr. Hough seems to have diligently prosecuted his investigations and inquiries, not only throughout the United States, but also in foreign lands, entering into a correspondence with officers of foreign governments connected with the forest management and forestry schools in Europe, where the vital importance of this great interest is well understood, and where for many years an intelligent and settled policy has prevailed, looking to the increase of the woods. The equal and seasonable distribution of the rain-fall, the maintenance of forests upon the higher lands, and the consequent preservation of the regular supply of water to the springs, rivulets, and rivers, and the prevention of the terrible floods which wash bare the unclothed mountain slopes, and by sudden overflows destroy the agriculture and the manufactures of the valleys, are also subjects of anxious observation in this connection.

While the information Dr. Hough has acquired from these sources has been extensive and in some cases exhaustive, and while from the European modes much may be learned,—the differences that exist between our own and foreign countries in the ownership of lands, make it impracticable to apply for the present, if ever, the systems of administration that prevail elsewhere. Differences exist also in climate, and in the native trees suitable for forest culture; yet there is a very large amount of information collected in the report which is not more valuable for practical use than it is for suggestive thought.

The forest codes of Europe have for us much that is interesting and instructive, in so far as they show to what extent the public welfare may justify governments in imposing restraints upon the enjoyment of forest

property held by private owners, and in so far as they illustrate the application of those fundamental principles which may justify a government in the exercise of its right of eminent domain. If our general and State governments cannot own and rear up forest plantations, as is done in Europe, where governments, communes, and public institutions own large tracts of land, they have a duty no less important in doing what cannot be done by individuals, in the collection of facts, and in the wide diffusion of information which may prompt the self-interest of our citizens to do that personally which cannot well be done by government in the settled States of the Union under our present system of widely distributed power.

The question of timber culture upon the great plains and timber preservation upon lands yet in possession and ownership of the general government is a problem of a different character, and one of the most interesting that can occupy the attention of statesmen. Successful forestry, in its very nature, necessitates an entire change in our careless methods and shifting, changeful habits, and compels us to do whatever is done thoroughly well, and to persevere in the well-doing; to select men fitted by nature for the occupation of foresters, and to secure them a life estate or a good-behavior estate in these occupations, is the lesson taught by our European contemporaries.

The growth of trees fit for civil and naval architecture is a work of generations, and, while not difficult under ordinary circumstances, requires a steadiness and constancy of purpose, application, and culture which has not as yet received any prominent illustration in our unsteady politics and legislation.

The author of this report has compiled, with wonderful industry and apparent accuracy, statistics of the most valuable character, embracing statements of the exportation of every class of forest products from each part of the United States to each foreign country from the organization of our government to the present time, and has summarized these tables by coasts and grand divisions, and in this particular the report may be regarded as entirely exhaustive.*

Other statistical tables of great interest are presented, which from the nature of the subjects are interesting, but from the want of time are incomplete, although valuable.

The report is also accompanied with illustrations of various kinds, and especially such as apply to the graphic method of presenting statistical facts and scientific comparisons when numerically expressed. Besides the chapters which deal with statistical and strictly scientific facts, the author has a wealth of matter, historical and instructive, which will be of interest not only to every agriculturist and land owner, but also to every thoughtful person whose views of life and its duties are not bounded by the narrow limits of his own existence, or whose national pride and patriotism hope for a prosperous future for his country.

In conformity with the law above recited, I herewith transmit the report, and respectfully recommend that it be stereotyped and printed in two volumes—the more strictly scientific and tabular portion in one, and that which is of common and universal interest in the other. By this method, editions of the work may be ordered from time to time, according to the demand, and as those persons desiring the tabular and scientific part will be fewer in number than those wishing for the more discussive and more generally interesting part, a large saving of money may thus be made.

* The printing of the statistical part of this report (here referred to by the Commissioner of Agriculture) has been deferred, by decision of the House Committee on Printing.—H.

I also respectfully recommend the appropriation of $8,000, or so much thereof as may be necessary during the next year, to prosecute these inquiries into the subject of forestry—$6,000 of which to enable Dr. Hough to continue the work he has so well begun, and for which he has so much really valuable matter in hand ready to be arranged, as well as to enable him to make personal inspection of European forests, if advisable.

I respectfully submit the above to the Executive, for transmission to Congress, in compliance with the terms of the act constituting the Commission on Forestry.

Very respectfully, your obedient servant,

WM. G. LE DUC,
Commissioner of Agriculture.

To the PRESIDENT.

LOWVILLE, N. Y., *December* 8, 1877.

SIR: I have the honor to transmit herewith a Report upon Forestry, prepared by me under an appointment made by your predecessor in office, in pursuance of a provision contained in an act of Congress approved August 15, 1877, entitled "An act making appropriations for the legislative, executive, and judicial expenses of the government for the year 1877, and for other purposes."

Very respectfully, your obedient servant,

FRANKLIN B. HOUGH.

The Hon. WILLIAM G. LE DUC,
Commissioner of Agriculture.

REPORT UPON FORESTRY.

In entering upon a consideration of the points of inquiry specified in the law under which this report is made, it is not deemed necessary to present facts tending to show the importance of a suitable supply and proper distribution of woodlands in the country, nor to urge the necessity of forest products for the supply of these materials for the daily wants of life, and the manifold uses to which they are applied in the arts. It is believed that no differences of opinion could arise as to the close dependence of our national welfare and individual comfort upon the maintenance of these supplies of wood and wood-products, or upon the importance of having a sufficient amount within convenient distance, and at moderate prices, through an indefinite period of coming time.

So abundantly supplied were the older States of the Union with a native-timber growth, that questions relating to permanence of the supply appear not to have suggested investigation through a long period, and in fact the great excess of forest over amount required for proper use, led at first to the clearing off of extensive regions to prepare the soil for cultivation, without yielding in return any direct benefit from the product other than the value of the potash made from the ashes. The misfortune has been, that this clearing was made without a thought as to the probable wants of the future, either for supply of materials for building, manufactures, and fuel, or for value of reserved belts of timber as a shelter from sweeping winds; and, as a consequence, the supplies have within a few years past been found scarce, and their prices have advanced to a degree that is sensibly felt by all classes of the population; for we cannot enhance the cost of building-materials, or of implements of wood, or the cost of fuel, without its being felt everywhere. Wherever these increased values affect the cost of building and maintaining ships or railroads, the expense of transportation is proportionably increased, as well upon freights of every kind as upon the cost of travelling.

In the prairie States and in the Territories, the absence of forests has been felt severely from the beginning, and the want, so far as relates to lumber, timber, and fuel, has been supplied at more or less sacrifice by bringing these materials from other sections of the country where they grew. This necessity has in these regions, brought the question of forestry before our citizens as one of practical importance, so that we find throughout the treeless portions of the country, a more general interest in the subject, than in those sections where the want has not been as yet materially felt. But in these older and naturally well-timbered sections of the country, thoughtful persons have for years been watching the wasting of supplies and the complete exhaustion of one forest region after another with an anxiety natural with those who look forward to the probable conditions that must necessarily exist in another generation, and who feel the responsibilities of the present with regard to the future.

Beginning, therefore, with the statement accepted as without denial, that a proper supply of forest products is indispensable, and that shade and shelter are of incalculable value to our agricultural interests, we may notice some facts that depend upon the rights of property in wood-

lands, as they exist in our country, and compare them with the conditions that prevail in other countries. We shall find that in Europe, and especially upon the continent, there are extensive tracts of land belonging to the general government or to local municipalities, or to institutions, and that over these a system of management has grown up, under different circumstances, and that at present, although there is a great diversity in the details, they all agree in this, that the management should be conducted without needless waste, and for the best interest of the owners. In many cases this system includes rights of enjoyment among the inhabitants of the commune, by which the land is owned; and not infrequently these rights, originating in customs of great antiquity, and, perhaps, in the beginning, of doubtful authority, have proved a serious obstacle to management under an enlightened code, by allowing practices that tend to ruinous results. In a subsequent part of this report some of these systems will be presented somewhat in detail; but they will prove with us of historical value, rather than of practical interest, because our circumstances are so different that they present few precedents for our guidance.

The tenure of lands within the United States is almost everywhere allodial; and, excepting as it is still held by the general or State governments for specific public uses or for future grant or sale, the land consists of freehold estates, the absolute property of the owners, without being subject to quit-rents, service, or acknowledgment to any superior. Excepting as he may pledge his estate for the security of a debt, the owner has no other obligation to others, further than to bear his just share of the expenses of government for the general protection of property and the maintenance of good order. The government still, however, reserves a right of eminent domain, under which private property may be taken, upon payment of its value, when needed for the public good; and under this right a qualified power is vested in the government for restraining from the use of private property where it may affect the rights of others.

Neither our national, State, nor local governments are the owners of land upon which timber can at present be planted and cared for until maturity at the public cost, with the least prospect of success. Where a government is administered by officers elected by the people, and where any citizen may be chosen to any office, and especially where these offices have a patronage that makes them especially desirable, they become at once objects of political ambition. Special qualifications for particular stations in public life afford no promise of employment, nor of continuance if employed, and hence we have no inducements to offer a young man who might aspire to a position for which he might have great native ability, and for which he would be willing to undertake the most thorough special education if he felt assured that employment would depend alone upon the most thoroughly approved preparation, or the most rigid examination. Hence it cannot, at least at present, be expected that our governments can undertake the practical management of forests, as is done in Europe, by officials specially trained for this pursuit, with the view of deriving a benefit from the cultivation. They can scarcely do more than prevent depredations upon the timber already growing, if, indeed, they succeed in this, where the property to be protected is not immediately under the care of a resident agent, who truly feels the responsibility of his trust, and is able to discharge its duties.

The experiences of pioneer life, as regards the timber, present little that can be commended and much that can be blamed. It has been observed in all countries and at all periods, that trees furnishing products

demanded by commerce, or standing in the way of cultivation, become an object of inconsiderate waste, and not unfrequently to such degree that the markets are overstocked, and ruin is brought upon the greedy but thoughtless adventurers in a business liable to bring an over-supply. This tendency has been exemplified over and again in our lumber and timber trade, and illustrations are too numerous and too recent to need mention. But, aside from the conceded propriety of proper clearings for cultivation in forest regions, the opportunities for trespass are too open and inviting to be resisted by the class of settlers who generally make the first and furthermost advances in frontier settlement; and too often the forest history of our most valuable woodlands would be a record of the doings of timber-thieves. The growth best suited for lumber, or timber, or shingles, or staves, has been taken where most convenient, without regard to ownership, and the products of this stealthy industry have been sold to unscrupulous dealers, who may have made small advances in supplies, well knowing from whence the returns would come. Finally, to cover these proceedings, fires may be set to burn up all traces of evidence, and when once started in the shavings of a shingle-camp, or among the dry brush of a timber-cutting, these fires may cause infinitely more damage than the depredations they were intended to conceal.

Such regions, when plundered, have sometimes grown up with an inferior class of timber or have been occupied by a more substantial class of settlers, by whom the first permanent improvements have been made. These descriptions of forest-waste are by no means local or applicable to particular regions, although they may vary according to circumstances and opportunity. The Saint Lawrence frontier of New York was stripped of its best oak-timber by thieves from Canada before settlement began. The pine-regions of Pennsylvania suffered greatly before notice was taken or measures adopted for preventing it, and the mining regions of the West present instances of waste far exceeding any that we meet with elsewhere.[1]

TIMBER RESERVATIONS FOR NAVAL CONSTRUCTION.

Reservations of timber fit for ship building were common in the patents granted for land in the colonial period, and the exportation of timber was from an early period an important item of industry and source of profit to the colonists.

The earliest measures taken by the Federal Government for the establishment of a Navy were under an act approved March 27, 1794, authorizing the President to provide four ships of forty-four guns, and two ships of thirty-six guns each, for the purpose of protecting American commerce against the depredations of Algerine corsairs. A small Navy had existed under the government of the old confederation, but from 1785 until the first ships were launched under the act above noticed in 1797, there was none.

[1] Mr. R. W. Raymond, in his second Report on Mines and Mining (1870), in speaking of the mining-interests of the Pacific States, says: "In this connection I desire to call attention particularly to one of the worst abuses attendant upon the settlement of the mining regions and other portions of the West. I allude to the wanton destruction of timber. This reckless and disastrous practice was extensively prevalent in the heavy fir and cedar forests of Oregon and Washington nearly twenty years ago. Timber was so abundant that to many it seemed inexhaustible, and they took especial delight in its destruction. Hundreds of square miles were burned over in a single season, and vast quantities of the finest timber in the world, easily accessible for purposes of commerce, either totally consumed or rendered utterly valueless. The same waste is yearly going on in all the Western States and Territories, and particularly in the mining regions of the Rocky Mountains." (*Report on Mines and Mining Statistics*, 1870, p. 342.)

The agents entrusted with this duty recommended the use of live-oak, being assured that, "the building of these frigates of live-oak will certainly be a great saving to the United States, as we are well satisfied (accidents excepted) that their frames will be perfectly sound half a century hence, and it is very probable they may continue so for a much longer period." The experience of the Navy fully justified this prediction. The importance of securing a sufficient supply of timber for the Navy was upon that occasion strongly urged,[1] and this finally led to an act approved February 25, 1799, appropriating $200,000 for the purchase of growing or other timber, or of lands on which timber is growing suitable for the Navy, and for its preservation for future use.

It will be remembered that Florida and Louisiana, extending along the entire Gulf coast and including most of the live-oak known to exist, then belonged to foreign powers, and that the amount of this timber within the Union as then bounded, was of very limited extent. Small purchases were made on the Georgia coast under the act of 1799,[2] but nothing of importance beyond this was done until 1817. On the 1st of March of that year an act was passed directing a reservation of such public lands, having a growth of live-oak or cedar timber suitable for the Navy as might be selected by the President.[3]

Under the act of 1817, surveyors were appointed, and a reservation was made upon their report of Commissioners, Cypress and Six Islands, in Louisiana, containing about 19,000 acres, and, as was supposed, about 37,000 live-oak trees fit for naval use, but some of them difficult of access.

In 1828, the sum of $10,000 was granted for the purchase of lands for the supply of live-oak and other timber for the Navy, and about 3,650 acres were bought on Santa Rosa Sound; and during two or three succeeding years a system of cultivation was undertaken.[4]

---

[1] "It will be well to consider that great quantities of the finest live-oaks are destroyed to clear the lands, and that some of the maritime countries must resort to this country for timber, which will, in a few years, put it out of the power of the United States to secure the quantity of timber they will most assuredly want, without paying an exorbitant price. If they were to purchase some of the islands plentifully timbered with live-oak, I have reason to believe they may be sold for the first cost after the timber is cut off." (*Am. State Papers, Naval Affairs, i, p.* 9.)

In December, 1798, the importance of buying some of the islands on the coast of Georgia was again urged in a provision for supplying the Navy with live-oak timber. (*Letter of Benjamin Stoddert, Ib.*, p. 66.)

[2] Grover's Island (350 acres) was bought by the President December 13, 1799, and Blackbeard's Island (1,600 acres) in April, 1800, the former for $7,500, and the latter for $15,000.

[3] The acquisition of Florida brought into the United States extensive groves of live-oak, but these lands were often so encumbered by claims under former governments, that the first examinations for lands with clear titles met with poor success. It was not until 1825 that an agent could be appointed, and he found that live-oak had been a staple export from the Saint John's River for a long time. During the last six or eight years the number of vessels with this timber as cargoes, had averaged 150 a year, carrying not less than 2,000 feet each at a load, or in all nearly two millions of feet within these years. This estimate caused much anxiety, and led to a recommendation by the Secretary of the Navy (January, 1827) urging the following measures:

1. The purchase of heavily-timbered lands.
2. The reservation of sufficient lands in Florida and Louisiana after proper surveys;
3. The planting of trees upon lands already owned by the government, or that might be bought, including Grover Island already cleared; and
4. The purchase and storage of large quantities of timber, which might be kept half a century if need be with proper shelter.

[4] This consisted in grubbing out the roots of other trees and clearing the ground around the live-oaks, so as to afford them better opportunity for growth. The few trials at transplanting were mostly failures, and growth from the seed was deemed more reliable. In 1829 and 1830, some 45,000 trees, mostly from two to six inches in diameter, were thus cleared and pruned.

Information upon the subject of live-oak reservations will be found in the *American*

By another act, approved March 3, 1827, the President was authorized to take proper measures to preserve the live-oak timber growing on the lands of the United States, and he was authorized to reserve such lands in sufficient quantities to render the same valuable for naval purposes. Provision was made by an act, approved March 2, 1831, for the punishment of persons in cutting or destroying any live-oak, red cedar or other trees growing on any lands of the United States, by a fine of not less than thrice the value of the timber cut and imprisonment not exceeding twelve months.[1]

The amount of land expressly reserved under the acts of 1817 and subsequently is as follows:

	Acres.
Alabama (November 28, 1832), three half-sections in Mobile County	240
Florida (October 23, 1830, to December 19, 1860, at various times), many detached parcels, chiefly in counties bordering upon the Gulf of Mexico and Suwanee River, including the whole of Santa Rosa Island	208,824
Louisiana (October 21, 1845), Pecan, Cypress, and Navy-Commissioners' Islands	9,170
Mississippi (October 30, 1832, to April 16, 1858), many separate parcels on the Gulf coast, including Round Island	26,218
Total	244,452

OTHER RESERVATIONS OF TIMBER LANDS.

Very limited reservations for public parks have been made in recent years, as will be more fully mentioned on a subsequent page.

There have also been made special reservations of lands around military posts, but of the amount of timber thus withheld we have no statistics. The various Indian reservations include considerable amounts of timbered lands, some of which may have been selected on this account; but of these no information has ever been publicly reported, and probably none has been obtained.

TIMBER ON THE PUBLIC LANDS.

In the sale of public lands through a long period, laws have been provided for the conveyance of land in mineral districts for mining purposes by exceptional modes of entry and at discriminating prices, but no provision has hitherto been made for the sale of valuable timber tracts differently from that which applies to prairies. Our proverbially valuable "pine lands" have been held at the same prices as other lands, although notoriously unsuited to agricultural purposes when once cleared of their timber, and have been held subject to pre-emption and homestead entry, although they have often been abandoned as soon as the timber was cut off.

Under the various acts already noticed, and by virtue of decisions and judicial rulings, these statutes were held to apply to the whole

State Papers, (Naval Affairs,) i, pp. 8, 27, 38, 41, 42, 75, 482, 586, 605, 689; ii, 624; iii, 47, 50, 211, 763, 917, 918; iv, 32, 98, 104, 107, 123, 163, 191, 204, 213, 218, 219, 220, 222, 223, and 368. See also *Ex. Docs.*, Nineteenth Congress, first session, vol. v, No. 85, and second session, vol. 5, No. 114; Twenty-first Congress, second session, vol. 1, No. 2, p. 234; *Reports of Committees* (same session), vol. 1, No. 102. *Ex. Docs.*, Twenty-second Congress, first session, vol. 4, No. 178, and second session, vol. 1, No. 23.

[1] *Statutes at Large*, iv, 471; *Revised Statutes of the United States*, section 2, 461.

United States,[1] and a system of timber agencies was established under instructions from the Solicitor of the Treasury.

In 1854 these agencies were discontinued, and supervision was transferred to the General Land Office, in the Department of the Interior. In 1855 a circular was issued, which remained the basis of regulation until 1877.† Under this, the officers of the several land-offices were directed, whenever reliable information reached them that spoliations of public timber were being committed, to investigate the matter, and to seize all timber found to have been cut without authority on the public lands, to sell the same to the highest bidder at public auction,

[1] Some of these decisions were as follows:

Intruders may be removed by military force under act of March 3, 1807. The United States have also the common-law and chancery remedies enjoyed by individuals for protection and redress. (*Attorney-General's Opinions*, I; Wirt, May 27, 1821.)

The rights of settlers in East Florida in respect to the cutting of live-oak were defined as follows: "They are not entitled to cut live-oak or other timber, except for the purpose of clearing, until they have complied with all the conditions of the law. The conditions precedent to that right are: the obtaining of a permit; residence five years in the Territory; the erection of a house; clearing at least five acres; and actual residence four years next following the first year of the date of the permit, with proofs of these facts in manner specified." (*Attorney-General's Opinions*, IV, 221; Nelson, August 11, 1843. See, also, *Id.*, IV, 405; Nelson, July 16, 1845.)

Case of United States *vs.* Ephraim Briggs, in which it was decided that "the title of the act would indicate that timber reserved for naval purposes was meant to be protected by this mode and no other. But the enacting clause is general, and therefore cutting and using of oak and hickory, or any other description of timber-trees, from the public lands is indictable and punishable by fine and imprisonment." (*Howard's Supreme Court Reports*, IX, 351; January term, 1850.)

† CIRCULAR OF COMMISSIONER OF GENERAL LAND OFFICE (1855 to 1877).

DEPARTMENT OF THE INTERIOR, GENERAL LAND OFFICE,
Washington, D. C., December 24, 1855.

GENTLEMEN: The Secretary of the Interior has concluded to change the present system of timber agencies, and to devolve the duties connected therewith upon the officers of the local land-districts. By this direction, therefore, you will, upon the receipt of these instructions, take charge of the timber business within the limits of your land district, as a part of the general duties of your office; and it is accordingly hereby assigned to you as such, with the understanding that, hereafter, it is to be considered and held as a proper incident to, and in fact a part of, your general duties, covered and satisfied by the salary which the law provides for your respective offices.

That you may understand the nature of this part of your duties, your attention is directed to the following:

1st. Attorney-General Wirt, in an opinion of the 27th of May, 1821, holds as follows: "Independent of positive legislative provisions, I apprehend that, in relation to all property, real or personal, which the United States are authorized by the Constitution to hold, they have all the civil remedies, whether for the prevention or redress of injuries, which individuals possess. (See 3 Wheaton, 181.) So the United States, being authorized to accept and to hold these lands for the common good, must have all the legal means of protecting the property thus confided to them that individuals enjoy in like cases. * * * * They are, therefore, in my opinion, entitled to the injunction of waste by way of prevention, and to the action of trespass by way of punishment, in like manner as individuals similarly situated are entitled to them."

2d. Attorney-General Taney, now Chief Justice of the United States, in an opinion of 22d August, 1833, cites this opinion of Mr. Wirt, and concurs in it.

3d. Attorney-General Mason, in a communication of 16th July, 1845, refers to the opinion of Attorney-General Nelson, of the 11th August, 1843, and, in concurring in it, states that, "when the right of pre-emption exists, the settler who has complied with the provisions of the act of 4th September, 1841, has a right of occupancy for twelve months, within which he may perfect his title by paying the minimum price of the land. Like the settlers under the armed occupation act, his right is inchoate only; and he has only those rights of property which are necessary to the perfecting of his title. He may clear the land, build on it, and inclose it with a view to cultivation. For these purposes he may use or destroy any trees which may be necessary, but within these restrictions, and necessary fire-wood, he is confined."

The penal act of 2d March, 1831, provides "for the punishment of offenses committed

and deposit the proceeds in the Treasury. They were to bring the offense committed to the attention of the proper officers, that the perpetrators might be arrested and held to answer as usual in criminal cases. The purpose being chiefly to protect the rights of the government, these officers were instructed to consider the circumstances of the case, and they might compromise on payment of costs incurred, and a reasonable stumpage for the timber, which was then released, and prosecution waived. Until 1872 no appropriations were made for this object. It was made a rule that the expenses incurred should generally be limited to the amount realized from the sale of timber seized, and from stumpage in cases compromised; but in some cases where the expenses

---

in cutting, destroying, or removing live-oaks and other timber or trees preserved for naval purposes."

This act of 2d March, 1831, you will find fully considered in the case of The United States *vs.* Ephraim Briggs (9 Howard, p. 351), in which the Supreme Court decided that the said act authorized the prosecution and punishment of all trespassers on public lands by cutting timber, whether such timber was fit for naval purposes or not.

4th. Under no circumstances will you compound or compromise with any such trespassers, or receive any pay or compensation from them as acquittal or discharge therefrom, or in any other manner; neither will you give any permission to cut timber or otherwise trespass on the public lands, as there is no authority for any such proceeding; but all such offenses against the law must be prosecuted and tried by the authorities duly constituted for that purpose.

5th. Should you find such trespass committed on *swamp* lands, or those which are rendered unfit for cultivation by overflow, you will take no further action than to notify the governor of the State, as all such lands inure to the State under the act of 28th September, 1850.

6th. In the enforcement of the said act of 1831, you should be careful not to interfere with pre-emption rights under the act of 4th September, 1841, the settler, with a view to cultivation, having the right, as hereinbefore indicated, to use or destroy trees in clearing roads and constructing bridges, or for any other purpose connected with the improvement of his homestead.

7th. While thus liberal to the honest settler, you should be vigilant to detect and arrest the speculator, who, in the guise of a settler, and under the sanction of a declaratory statement, may contemplate the spoliation of timber, and unless arrested might seriously injure the public interest.

8th. Where the tresspassers are unknown or known, and timber has been cut or removed off the public lands, you will cause it to be seized and sold at auction to the highest bidder, under such regulations as sound discretion may suggest.

9th. All moneys, the proceeds of the sale of timber received by you, must be deposited in some of the United States depositories, to the credit of the judiciary fund, without abatement, and an immediate report made of the same to this office, with a full statement of all particulars duly verified.

10th. In the prosecution of your duties you may, upon any pressing emergency, deputize a reliable person to investigate and report the facts involved in any supposed case of tresspass, and allow a per diem of three dollars and a mileage at the rate of ten cents per mile.

In making any such appointment you will report the fact instanter, and the necessity for it, and will require in the affidavit of the employé a statement of the time actually occupied in the service and the distance traveled. An account verified by the party and certified by you should be reported to this office for payment.

Where there is no pressing emergency for the appointment of an agent, you will refer the facts to this office for consideration and await instruction.

11th. In returns to this office of sales of timber you will be careful to designate the places of seizure, the quantity and kind of timber, whether in logs or manufactured, price per foot, with the names and residences of purchasers, and cause the same to be verified by a certificate from the party making the seizure and sale.

12th. You are directed to make a report at the end of each quarter, the first to be rendered on 1st April next, of the proceedings of your office pursuant to those instructions, and showing the operations of this system as preventive means; also the number of acres entered by trespassers through its constraining influence.

You are requested to acknowledge the receipt of this, and advise me of such preliminary steps as you may take with a view to a compliance with the foregoing instructions.

Very respectfully, your obedient servant,

THOMAS A. HENDRICKS,
Commissioner.

incurred exceeded the receipts, the deficiency was made up from the judiciary fund.

In 1872 appropriations were made for the pay of agents, and these have since been continued, the sum for four years past being $5,000 a year, and the whole amount thus granted making $45,624.76. The receipts in all, from stumpage and other payment for timber taken from the public lands have amounted to $199,998.50, leaving only a balance of $154,375.74 for the many millions' worth of timber taken from the public domains.

The Commissioner of the General Land Office has repeatedly called attention to this very unwise and improper policy, and in his report for 1874–'75—repeating the language of his last report—in reference more particularly to our pine lands, he says:

> The product of these lands is of universal use, and forms the staple of commerce of no inconsiderable portion of the nation. The difference between the government price and the actual value thereof is large, yet Congress provides that these lands shall be disposed of under the pre-emption laws at $1.25 per acre, or under the homestead laws by commutation, under the eighth section of the act of 1862, at the same rate. It is true that the law provides that in the discretion of the President this class of lands may be proclaimed and sold at public outcry to the highest bidder; but the experience of this office shows this method to be entirely ineffectual for the reasons, first, that under the ordinary system of surveys the field-notes cannot disclose, with any degree of accuracy, which are pine lands and which are not; and second, that there is little room for doubt that combinations are formed among purchasers at government public sales whereby prices are kept down to a merely nominal figure. The usual result is, therefore, the government receives the minimum price of the lands, *less the large expense of three months' advertising required by law.* Another and greater evil results from public sales under existing laws. This office having, as I have before stated, no reliable means of distinguishing pine lands, is reduced to the necessity of including in the proclamation all lands *supposed* to contain pine. It results that only such small proportion of the tracts proclaimed as are known to the purchasers to contain pine are sold, while the great mass of them, receiving no bid, remain with the government as "offered lands," *subject thenceforth to private cash purchase without settlement*, and become the easy prey of non-resident speculators, thus defeating the now well-established and beneficent policy of the government in that regard. The remarks here made apply as well to the "fir lands" of the Pacific as to the pine lands east of the Rocky Mountains, and are indeed of more importance as bearing on the question of the future disposals of "fir lands," since the quantity of "pine lands" remaining unsurveyed and unsold is now comparatively limited. Under this state of facts I would urgently recommend the passage of a law providing—
>
> First. That pine and fir lands shall not be subject to entry under the pre-emption and homestead laws.
>
> Second. That a system of survey shall be devised by which the quantity of pine or fir in each smallest sub-division of a section may be at least closely approximated.
>
> Third. That an immediate exploration by experts of the unsurveyed portions of those States and territories known to contain pine or fir, be authorized, with the view of ascertaining the geographical situation of pine and fir districts on fields.
>
> Fourth. That the reports of such explorations be followed by immediate survey of these districts.
>
> Fifth. That the survey be followed by immediate appraisal, proclamation, and sale, at not less than the appraised value, and for cash only.
>
> As I have indicated in the foregoing suggestions, I am strongly of the opinion that the wisest policy the government can pursue in respect to this class of lands is that which will most speedily divest it of title in the same for a fair consideration, for the reason that depredations to an enormous extent are constantly occurring, which existing laws are powerless to prevent, and seemingly equally powerless to punish.

In reiterating this advice, the Commissioner remarks:

> It is among the traditions of this office—certified indeed by its records—that from a very early day, eagerness to acquire title from the government to these exceptionally valuable lands for speculative purposes has led to the perpetration of innumerable frauds. It is notorious that, as a rule, the soil itself of these lands possesses but limited fertility; and it is equally certain that such of them as are entered upon under the pre-emption and homestead laws, are not generally so taken with the purpose of adding value to the tract by cultivation, but rather with the expectation of profiting by the after sale of the timber growing upon it. Through the facilities furnished by that provision of the pre-emption laws which, for unoffered lands, extends to applicants a credit

of thirty-three months, opportunity is found under cover of the declaratory statement which gives to the pre-emptor protection in his possession of the tract to strip the lands of their timber and thereupon to abandon them without even the payment of the minimum price.

These remarks were chiefly applied to lands of the class designated as lying eastward of the Missouri River, and along the Pacific coast. In this latter a large part of the timbered region of that coast has not been surveyed, and yet already "from them have been taken the vast supplies necessary for mining and smelting operations, for the building and maintenance of railroads, and, indeed, for the supply of every form of industry and improvement within the district of country embracing the States into which timber enters as a necessary part. Data are not accessible for forming an estimate of the value of the public property thus used and destroyed without return to the Treasury."

Moreover, the great mining and smelting operations of the Pacific States depend largely upon a continued supply of timber, and it is perfectly well known that although timber of some species grows to an enormous size, and that in some districts the yield per acre is almost beyond power of belief, yet the area is not large; much of it is difficult of access, and a prudent forethought should be exercised in its preservation and economical use. Of course these lands cannot be sold until they are surveyed, and at present they are entirely without even nominal protection. As title cannot be obtained, the necessities of the country lead to the procuring of timber wherever it can be got, and thus every person having occasion to use forest products, is either obliged to commit depredations upon the public lands himself, or to procure them of others, "knowing them to have been stolen."[1]

[1] Recent investigations by a special agent of the Department of the Interior under instructions from the Commissioner of the General Land Office, have, according to accounts published in the public journals, and reported officially to the present Congress, shown that the depredations upon public timber in recent years, have amounted to many millions of dollars. Some lumbering firms and individuals have acquired vast wealth by these operations. The pecuniary loss thus occasioned is not the only injury done. A demoralizing effect has been wrought in the minds of a certain class, who seeing government property openly taken, under the eyes of public officers, without notice, have come to regard this class of property as common, and communistic principles of most dangerous tendencies have been encouraged.

Whatever may be the legal rights involved, it cannot be denied that timber growing upon government lands in the newer States and in the Territories, is often loosely regarded as applicable to the wants of settlers; and where it is scarce there is little hesitation in taking it wherever found most convenient. With a public sentiment justifying this course, it is idle to expect that laws or regulations alone will ever protect it, or that prosecutions tried before a jury will ever lead to conviction. The same may be said of the scanty belts of timber growing upon lands granted to railroads, and upon the lands of non-resident owners. It is even doubtful whether any regulations tending to restrain from waste or improvident use would be heeded in the absence of authority upon the spot sufficient for protection. Such native growths appear to be regarded, like wild fruits, a proper object for use wherever found, and it is not until timber is planted and cared for by an owner that it comes to be regarded as the property of the soil, to be enjoyed, like a field of grain, by the man who has planted it or his successor in title.

These facts are stated as among the difficulties to be met in whatever legislation may be found practicable to undertake, and not in the remotest degree as a justification, of the sentiment believed to exist. The inducements and opportunities for this irregular proceeding are chiefly to be found in the Territories, remote from lines of communication, and they prevail most among the class of persons that precede the tide of permanent emigration—in fact, among those who seek to acquire a title to the lands they despoil. It is an incident that was observed under somewhat different circumstances, in the first settlement of what are now the Eastern States, where the injuries, although greater in amount, were less in extent, and perhaps, where this habit of improvidence was first acquired. They may be regarded, however deplorable, as not likely to continue, as the land comes under the protection of resident owners, among whom we may expect a better sense of justice to regards the rights of real estate.

Still worse, the system of lumbering heretofore practiced in that region exceedingly wasteful—not more than half the timber that is felled, being used for any useful purpose whatever. The rest is left to decay, or becomes a prey to the flames, which, finding an abundance of dry material upon the ground, throughout the lumbering region, sweep over the districts in dry seasons, destroying not only much standing timber, but everything in the way of young shoots and undergrowth by which the slow process of reproduction may in some places have begun.

Again, in the report of 1875–'76 (a change having brought another Commissioner into office), we find the following views expressed with regard to the sale of timber lands:

A national calamity is being rapidly and surely brought upon the country by the present destruction of the forests. Much of this destruction arises from the abuses of the different laws for giving land to the landless. The operation of these laws is salutary in many settlements are made under them, upon lands fit for a home and cultivation by the industrious; but the policy, if such it may be called, of allowing the pine lands to be entered upon under the pre-emption and homestead laws is a mistaken charity, and of great evil. These lands, whether situated on the Atlantic or Gulf coasts of the South, the Lake Superior and Upper Mississippi regions of the North, or on the mountains of the Territories of the great interior and the Pacific coast, are alike unfit for agriculture, and in no manner meet the requirements of a home and continued residence for the agriculturist; they are valuable only for the timber growing upon them. Therefore, when these lands under the homestead and pre-emption is abandoned. In the timber region of Lake Superior and the Upper Mississippi, where vast areas have been entered under the pretext of agriculture, under the homestead and pre-emption laws, scarcely a vestige of agriculture appears. The same is true on the Pacific coast and in the mountainous regions of Colorado, Utah, Montana, and Idaho.

As a remedy for these abuses, the report above quoted suggests the reservation of land under suitable protection, or its sale at its proper value as the interests of the country require it. To accomplish this sale, the land should be surveyed and appraised by experts, the value being based upon the amount and accessibility of the timber. There should be an absolute confiscation of timber cut upon the public lands, and a fine and imprisonment, instead of an easy settlement by compromise, as now the custom. The sales should be for cash only, and in the mining districts a reasonable price should be required for the wood sold for mining purposes. It was believed that pine lands, honestly appraised at their true value, could be sold as fast as needed, and that the timber thus acquired would be carefully husbanded in the hands of owners, who, having paid a fair price, would desire the largest return from their investment. He remarks:

It is an anomalous fact that the government is giving away the rich alluvial soil of Iowa, Nebraska, Kansas, and Minnesota to any citizen who will plant a few acres of cottonwood or other inferior timber, while under the provisions of the pre-emption and homestead laws it is granting a license to destroy millions of acres of pine forests of almost immeasurable value, which should be preserved as a nation's heritage.

He urges immediate attention to this subject, as every day of delay will continue to add largely to the already enormous losses of the government.

The system established in 1855, by a regulation of the department, in the absence of legal provision expressly defining its powers, remained in force until 1877, when the accumulated evidence of its defects led to the issue of the following:

DEPARTMENT OF THE INTERIOR, GENERAL LAND OFFICE,
Washington, D. C., May 2, 1877.

To Registers and Receivers of United States Land Offices:

GENTLEMEN: The Secretary of the Interior has concluded to change the method formerly adopted for protecting the timber on the public lands, by which you were made agents for that purpose within the limits of your respective land districts, as

per circular of December 24, 1855. Pursuant to directions from him of the 5th ultimo, the instructions of that circular are hereby revoked.

Hereafter, as it may be found advisable, from time to time, for the end in view, clerks or employés will be detailed from this office to act under instructions of the Commissioner in ascertaining when, where, and by whom depredations have been committed upon the public lands, and to report to him the facts in each case.

If, upon an examination of the reports so obtained, the Commissioner finds that the facts elicited in any case warrant the commencement of legal proceedings to punish the trespassers, or to collect damages for the waste already committed, or both, he will report the same to the Secretary of the Interior, with his opinion thereon, in order that such further proceedings may be had in the premises as the case may require.

The clerks or employés detailed as aforesaid will not be permitted to make any compromise for depredations committed on the public lands. If any propositions are submitted to them with that object, they will be required to report the same to this office, with a full statement of the facts in the case, showing the nature and extent of said depredations, when and by whom committed, the amount and value of the timber when cut, and the value of the land in its present and former condition; all of which, together with the opinion of the Commissioner, will be submitted to the head of the Department for further consideration.

If, in any case, the emergencies should seem to require more prompt action than is contemplated in the rules above indicated, in order to arrest the offender, or to secure the Government for the damages suffered, it will be the duty of the clerk or employé detailed to act in the matter to make direct application to the United States district attorney for the district in which the waste was committed to institute the proper legal proceedings for that purpose. This course, however, must be taken only in cases where the evidence is clear and indisputable.

The foregoing is communicated for your information. You will observe therefrom that you are not hereafter to act as agents for the protection of the public timber, although your co-operation is expected whenever you may be called on to render assistance to officials charged with the duty.

Very respectfully,

J. A. WILLIAMSON,
Commissioner.

It is understood that numerous proceedings have been already commenced against trespassers upon the public lands since these regulations were issued, and enough has been done in enforcing the rights of the government against those who have committed these depredations to prove that a considerable revenue may be derived from the sale of timber. But there are questions arising with regard to the future, infinitely more important than present revenues, and these will, it is earnestly hoped, engage the attention of Congress at an early day.

TIMBER-CULTURE ACTS OF 1873 AND 1874; AMENDMENTS OF 1876 AND 1877.

An act entitled "An act to encourage the growth of Timber on Western Prairies," approved March 3, 1873, was designed to offer direct encouragement for the planting of trees upon the prairies. The provisions of this act were briefly as follows:

1. Any person who should plant, and for ten years protect and keep in a healthy growing condition, *forty acres* (the trees being not more than 12 feet apart each way) upon government land, was to be entitled to a quarter-section (160 acres) at the end of the ten years, the facts to be proved by two credible witnesses. Only one-quarter of any one section could be thus granted.

2. The party applying for entry was to make affidavit before the Register or Receiver of the proper land-district as to the purpose of the entry, and must pay a fee of $10 and the prescribed commissions.

3. Upon proof that the person who has made the entry has abandoned or failed to cultivate, protect, and keep in good condition the timber, the tract was to revert to the United States.

4. Persons who have made a homestead entry, and who at the end of

the third year of residence might have had under cultivation for two years one acre of timber, in manner above designated, for each 16 acres of said homestead, might, upon due proof, receive his patent for said homestead.

5. Lands thus acquired were not to become liable for debt prior to the issuing of patent.

Forms and regulations were to be issued by the Commissioner of the General Land Office, and penalties for perjury were imposed.

This act was amended March 13, 1874, as follows:

The privilege of entry was confined to persons who were heads of families or over 21 years of age, and were citizens of the United States or had declared their intention of becoming such. The time for perfecting title was reduced to eight years. The planting might include 40 acres in a quarter-section, or 20 acres in 80, or 10 acres in 40, or a fourth part of any fractional subdivision of land less than 40 acres, but not more than a quarter-section could be entered by one person.

The person making the entry is required to break one-fourth of the area to be devoted to timber within one year from the date of entry; one-fourth part more within two years, and the remaining half within three years from the date of entry.

One-fourth part of the area to be planted must be set out in timber within two years from the date of entry; another fourth within three years, and the remaining half within four years. The same provisions with respect to spaces between trees and their cultivation and protection, that were embraced in the original act, are contained in the act as amended, except as to the time for maintenance before the issue of a patent.

In case of the death of the person before the full amount is planted, his heirs are to have the option of completing his undertaking or of receiving a patent for a part upon relinquishing their claim to the remainder. No patent is to be issued sooner than eight years after entry, and proofs of compliance with the terms of the law are required. Upon proof of neglect or abandonment, the land becomes liable to homestead entry or entry under the provisions of the timber-culture act, but not until the original claimant has been notified and opportunity given for defense.

The provision relating to planting by those who had already located a homestead were continued, as also the exemption from debt before issuing of patent. The Register and Receiver of the district land-office are entitled each to receive $2 at the time of entry and the like sum when the patent is issued. Those who had already made entries, were allowed the benefit of this act upon complying with its terms.

The timber-culture act of 1874 was further amended May 20, 1876, by adding a proviso:

That whenever a party holding a claim under the provisions of this act, or whenever making final proof under the same, shall prove by two good and credible witnesses that the trees planted and growing on said claim were destroyed by grasshoppers during any one or more years while holding said claim, said year or years in which said trees were so destroyed shall not work any forfeiture of any of the rights or privileges conferred by this act; and the time allowed by this act in which to plant the trees and make final proof shall be extended the same number of years as the trees planted on the said claim were destroyed in the manner specified in this section.

That the planting of seeds, nuts, or cuttings shall be considered a compliance with the provisions of the timber-culture act: *Provided*, That such seeds, nuts, or cuttings of the kind and for the purpose contemplated in the original act shall be properly and well planted, the ground properly prepared and cultivated; and in case such seeds, nuts, or cuttings should not germinate and grow, or should be destroyed by the depredations of grasshoppers, or from other inevitable accident, that the ground shall be

replanted or the vacancies filled within one year from the first planting: *Provided*, That the parties claiming the benefit of the provisions of this act shall prove, by two good and credible witnesses, that the ground was properly prepared and planted in such seeds, nuts, or cuttings, and were so destroyed by inevitable accident in such year.

That it shall not be necessary to plant trees, seeds, nuts, or cuttings in one body, provided the several bodies, not exceeding four in number, planted by measurement, aggregate the amount required and in the time required by the original and amended act.[1]

In rulings under this act, the General Land Office has in some cases excepted the Osage orange, box-elder and white willow from the classes of timber that may be planted by those seeking to acquire title by timber-culture. We are unable to see a just reason why either of these should be thus excluded, as each of them in its proper soil and climate becomes valuable. It would be difficult to find a more precious timber for wagon-making than the *Bois d'arc* (Osage orange) of Arkansas and Texas; a more serviceable tree than the box-elder on some parts of the Western plains, or a better tree for screens and wind-breaks in Northern Iowa and in Western Minnesota than the white willow. These rulings are not understood to have been general, and it is to be hoped they will not in any case be permanent.

Some care has been taken to make personal inquiries of persons who have had opportunities for observing the operation of the timber-culture act, and in addressing circulars of inquiry for statistical information upon this subject, the Registers of land districts were asked to state any suggestions of amendment which in their judgment were desirable, some of these are given on the following page. With respect to its present operation, I fully concur with Hon. Leonard B. Hodges, of Minnesota, in his statement of the defects:[2]

First. It is requiring more of the settler than he is able to accomplish. The result is, in a very large majority of cases the law is not complied with any further than to file the claim in the land-office, pay the entry-fee, and break ten acres. By this time the settler begins to realize the nature of the contract he has undertaken to execute. He now sees clearly that he is too poor to do the work as it should be done. He begins to evade the plain intent and spirit of the law, in the painful economy of time and labor he can so poorly afford to expend. Not that he wishes to defraud the government or shirk his responsibilities, but rather from an inadequate realization of what *must* be done, and a natural desire to save what he has invested and can so poorly afford to lose, leads him into such crooked practice as we see on nine-tenths of the quarter-sections held under the provisions of this act. Another defect in the law is in the extreme facility land can be held by parties who make the claim, with no serious intention of planting any trees, but simply to do a little breaking and take his chances in selling his interest in it, in the course of the two years he can hold it, for a profit. In this way, and aided by extensions of time, granted on account of destruction by grasshoppers and other unavoidable accidents, large quantities of very desirable government land is prevented from being occupied and improved by actual settlers. Thousands of acres of government lands are thus held, free of costs or taxes, and I see no difficulty in a company of ingenious operators, doing an extensive real-estate business under the workings of this act, for quite an extended and indefinite period of time. Another defect in the Congressional timber-culture act is the clause permitting the trees to be planted "not more than twelve feet apart each way."

This is a very serious defect, and of itself virtually defeats the objects and purposes of the act. Nature shows us plainly how forests are grown, and it is folly on the part of Congress to evade or repeal natural laws governing the growth of forests. Nature plants thickly, pays no regard to the permission of Congress to plant so wide of the mark as twelve feet apart each way, and succeeds. In her own way she grows more timber and better timber on ten acres than the settler can in the mode indicated by Congress on forty acres, and at a tithe of the expense. To illustrate: forty acres

[1] By an act approved March 3, 1877, it is provided that where crops were destroyed or seriously injured by grasshoppers in 1877, the claimant is allowed to be absent from his lands till October 1, 1878, under such regulations as might be prescribed, and if these insects reappear in 1878, a like leave is granted till October 1, 1879, without prejudice of rights.

[2] *Report of State Forestry Association*, 1877, *p.* 44.

planted twelve feet apart each way must be thoroughly cultivated during the growing season of each year, until the growing trees have attained such proportions as to shade and mulch the ground. It requires the constant daily labor of the settler during the growing season from May to August. The parties sought to be benefited by the act are too poor to give so large a portion of their time to the work. The "human necessity for daily bread" compels their attention to the care of growing crops, upon which existence depends. It is a notable fact that thus far the only successful and genuine cases of tree-planting under the provisions of this act that have come under my notice are those where the planter has been financially able to plant closely; say on an average of four feet apart each way.

A forest so planted, with prompt and thorough cultivation for three years, is a success. The chief cost is terminated in three years from planting; the young trees make a straight, upright, vigorous growth; they soon cover and shade the ground so thoroughly as to effectually prevent the growth of weeds or grass among the trees, and the annual mulching from the falling foliage keeps the ground moist and friable, obviating the necessity of cultivation, and promotes the "healthy growing condition" which the act of Congress very properly requires.

On the other hand, the evasions of the law are painfully conspicuous. In many instances strips of breaking three or four feet wide, parallel with each other, are either planted with tree-seeds or cuttings, so as to bring them within the distance allowed by law. The planting is usually done in the raw sod, left without care or cultivation, smothered in rank weeds and grass, and swept over by successive prairie fires. It is difficult to employ language sufficiently vigorous in denouncing such childish folly. It is as idle to expect to grow a crop of forty acres of forest-trees without first breaking every foot, then followed after the decomposition of the sod by thorough plowing and repeated harrowing, as it would be to expect to grow a paying crop of corn by digging post-holes 12 feet each way on the unbroken prairie and dropping the seed therein. A modification of the timber-culture act requiring the settler to plant not less than 2,700 trees per acre, instead of 300, and ten acres instead of forty, would accomplish the objects contemplated by the framers of the act, and in time prove an incalculable blessing to the treeless wastes of the Western and Northwestern States and Territories. * * * The law, to be available and productive of the greatest good to the people and to the country, should be so amended as to allow all who have already made claims under its provisions to be allowed to plant ten acres instead of forty: to plant not more than 4 feet apart each way, and to be planted within four years; two and a half acres the second year; two and a half the third, and five the fourth. The claimant should be compelled to report the actual condition of his timber-plantation annually to the Register of the land-office of the district in which the land is located. He should be, by the terms of the act, compelled to do his work in a thorough and workmanlike manner, to keep the ground well and thoroughly cultivated, until such time as the growth and development of the trees shall have rendered such further cultivation impracticable and unnecessary. And he should be required to fill all vacancies occurring from any cause within one year; such report to be verified by the affidavit of the claimant and also by the affidavits of two competent and disinterested witnesses, failing in which the land should be open to settlement by other parties.

It is urged in objection to such modifications of the timber-culture act, that Congress never would consent to give away sixteen acres of land for the planting of one acre of timber.

Now this objection brings up one more modification, and that is to make the provisions of the act cover every quarter section of government prairie land within the limits of what is universally recognized as the "treeless region," instead as now only every fourth quarter-section.

In a district in Kansas where numerous entries have been made, the Register remarks:

As the law now is, I think it fails to accomplish the object for which it was enacted. Under its provisions any person qualified can enter 160 acres of land and hold it two years (by breaking ten acres of prairie) for speculative purposes. If the law was so amended that no person could enter more than 40 acres (except in cases where a sixteenth subdivision of a section is fractional, and contains more than 40 and less than 80 acres), and having the same requirements with regard to planting one-fourth of the area, &c., in timber, as at present, and reducing the fees to $5 and the commissions to $2 for each entry, in my opinion the law would be much more likely to accomplish the object for which it was intended than it now is. A greater number of people would be supplied with timber, if successful in growing it, and there would be a greater *probability* of being able to comply with the provisions of the law in planting and growing the timber than at present. And, besides, settlers would not be nearly as likely to enter 40 acres for speculative purposes as 160 acres. If any of the timber-culture entries which have been made in this office are ever perfected, I think it will be almost exclusively entries containing 40 and 80 acres.

In one of the land districts of Colorado the Register suggests that the amount to be planted under the timber-culture act should be reduced one-half.

In a district in Minnesota it was suggested that the area of entries should be reduced to 40 acres, or the smallest legal subdivision, and that the restriction should be removed as to the number of entries in any one section. The person making the entry should be required to break ten acres within one year from date of entry, and to plant with trees two acres within .three years, three acres within four years, and five acres within five years, the trees to be kept in a good growing condition until ten years from date of entry.

The Register of a district in Minnesota suggests the three following amendments as desirable, according to his observation:

1st. A reduction in the number of acres to be planted from one-fourth to one-eighth of the area entered, with the same number of trees thereon as is now required by the act of 1874. Experience has demonstrated that timber, to be grown successfully, should be planted closer than 12 feet apart. The reduction in the acreage to be broken and cultivated would enable the settler to make a much more thorough cultivation of his timber, resulting in a correspondingly increased growth.

2d. I would suggest a modification of the fees and commissions paid in timber-culture entries, to correspond with the fees and commissions paid for homestead entries of like area and cash valuation. There is neither justice nor equity in requiring one man to pay the same fees for the entry of 40 acres of land held at $1.25 per acre that are exacted from another who enters 160 acres of $2.50 per acre land.

3d. Allow a settler who has complied with the requirements of the law by planting the *full amount of timber*, and keeping the same in good condition for two years, to commute his entry by making cash payment therefor, if he elects to do so, instead of waiting eight years to receive his deed.

An observer living in a prairie region of Minnesota, where planting is a first necessity, remarks that the timber-culture act requires too much from the party complying with its provisions. The breaking of ten acres of tough prairie sod the first season, so that it would be fit to plant the second, then plowing another ten besides setting the first, would cost at least $1,000 to start on; and before the title was secured, much more. In the mean time he must earn food for himself and family. He thinks that five acres a year, and twenty acres to the quarter-section, is all that should be required.

A practical planter of large experience in Wisconsin suggests that a limitation should be placed upon the cultivation of trees under the timber-culture act, so that not over one-fourth or one-third should be cottonwood; the remainder being of the more valuable kinds; such as the ash, Scotch white, Austrian pitch, and red pines, sugar-maple, black walnut, European larch, black cherry, hickory, &c. The effect would be to give to the country a more valuable growth, and thus tend to greater benefits. He also suggests that on hilly and broken surfaces of the public domain the planting be restricted to *groups*, and on level land to *belts*, upon the four sides of each 160 acres; also that a row four rods wide be reserved on all section lines.

A suggestion has been made by an intelligent correspondent in Wyoming Territory, in reference to the operation of this act, that deserves attention. He remarks that in that Territory nothing will grow without irrigation, and a person cannot get water out of a creek valley without going to expenditures far beyond the means of a poor settler. He is, therefore, forced to plant the trees in the valley along the creek, where they can be irrigated. But as these valleys are generally not more than a quarter of a mile wide, and as his lot must be square, if he gets a piece of land with a valley across the middle, a part will lie on the bluffs and be worthless. By the time he gets 40 acres of trees planted on land near

the water, he has no land left for cultivation. The only relief from this would be a modification in the law, allowing the location to be made of irregular form, to suit the necessities of the case. This correspondent suggests that the area required for planting should be reduced from a quarter to an eighth, as forty acres of trees in that part of the country would require all the labor of one man during the summer to keep them alive, and adds:

I have tried twice to raise trees in this Territory, and have failed each time. If a man should get 160 acres of land for keeping even *twenty* acres of trees in a growing condition for *four* years, I would say he had paid high for his land.

The Register of one of the districts in Utah suggests, in view of the importance of tree-planting to the future welfare of the country, that it should be made imperative on every man entering public land that he plant and raise from five to ten acres of timber, as a condition-precedent to the granting of a patent.

In one of the districts of California the following statement and suggestions were made:

In this land district a very large proportion of the timber-culture entries were obviously made, not for the purpose of cultivating timber, but for the sole purpose of acquiring, for one or more years, a right to land so entered for the purposes of sheep pasture. I would suggest, first, the timber-culture affidavit should be more strict and full, requiring the entering party to swear that the entry is not made for the purpose of pasturage, and is not made for the benefit of any other person, in order to obtain pasturage. Second. The timber-culture application should *not* be an *entry* of the land; it should be merely a *declaratory statement*, giving all the rights which the law now gives, if a compliance with the law is made, but permitting any other filing or entry to be made over the timber-culture declaration, subject, of course, to the legal rights of the timber-culturist. If the timber-culture act permitted *timber-culture declarations*, instead of *timber-culture entries*, it could do no harm, and it might do much good.

Prof. E. Gale, of the Kansas Agricultural College, Manhattan, in remarking upon the timber-culture act, and especially that clause which permits the planting to be twelve feet apart, says:

The value of close planting can be realized much better after the very sad experience of 1874. There are several points that may be urged for close planting. The force of these observations will be much better appreciated when we have carefully examined the facts which can be adduced from experience. Trees should be planted closely—

1. For the mutual protection of the trees.
2. For economy in culture.
3. For immediate protection.
4. For the purpose of securing available timber.
5. For the purpose of securing early returns from our planting.

There is nothing more evident than that we should shape our plantations with reference to protection. The importance of this whole subject demands that it receive more careful consideration on the part of the planters. A very few acres of timber judiciously planted will prove of great advantage over a very large farm. Twelve acres arranged in belts will be far more desirable than forty acres in a body. The whole subject demands attention, as it is intimately associated with the highest interests of the State. It is to be seriously questioned whether the present shape of our timber act may not be such as to hinder, rather than to promote, the interests of forestry on the plains. The manner in which trees must be spread over forty acres of land will, in a vast number of cases, defeat the object aimed at. The reasons for this view are:

1. The cost of planting and cultivating forty acres of timber will be far more than the quarter-section is worth.
2. Very few of those who go to the frontier will find it in their power to support their families and comply with the conditions of the act.
3. The danger arising from these exposed or open plantations is, that all the trees are subject to suffer from the vicissitudes of our peculiar climate.
4. Trees thus planted will not serve the purpose of a forest, but virtually become an open orchard.

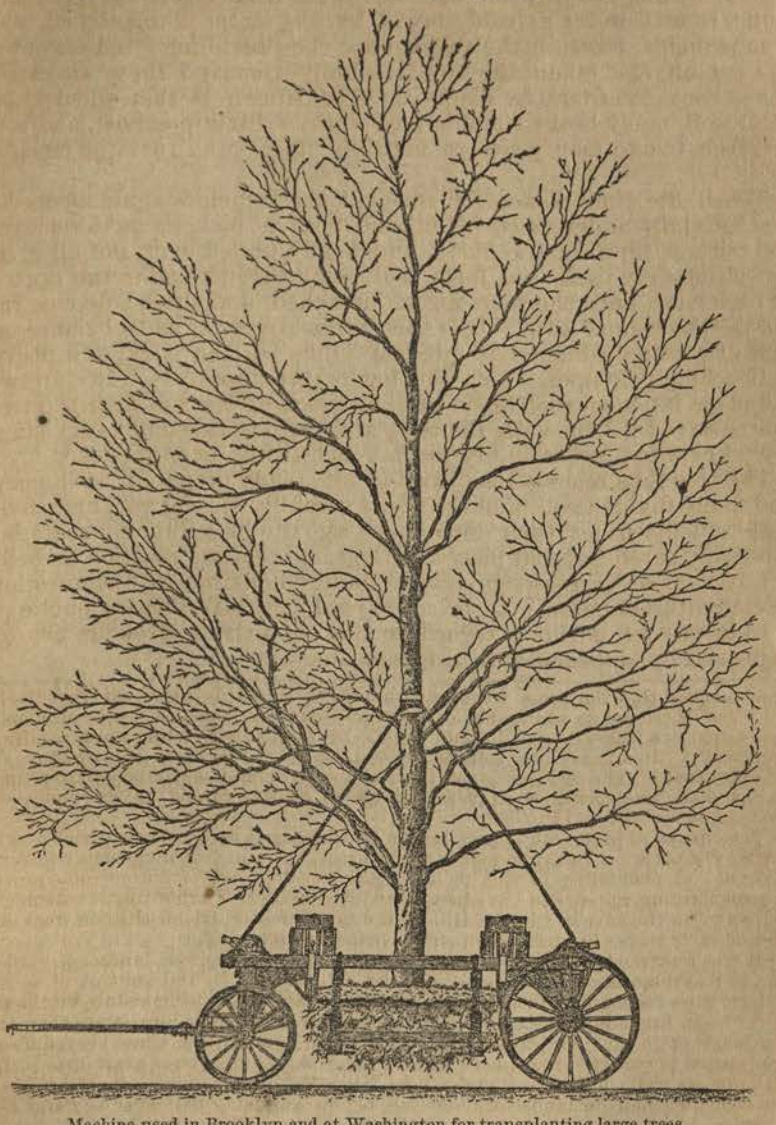
In northern climates the transplanting of fruit and forest trees may be done with great certainty and success, by digging a trench three or four



Machine used in Brooklyn and at Washington for transplanting large trees.

feet from the trunk of the tree, and to some depth below the roots in the fall of the year, taking care that the trench is properly drained of stand-

of windlass on wheels. When used, the machine is brought over the roots, which have been carefully bound with canvas, retaining all the fibers and soil that can be saved in contact with them, and chains are passed under and around the ball. The tree is then raised by turning the windlass, and the axle is fastened by a cord passing from the handles to a hook on the shafts. The wheels should be supported upon planks, and one side of the excavation should be graded down so that the machine will pass up the inclined plane. A similar slope is made on one side of the hole where the tree is to be placed.—(*The Tree-Lifter, or New Method of Transplanting Forest Trees.* By Col. George Greenwood. London. 3d ed., 1876, p. 235.)

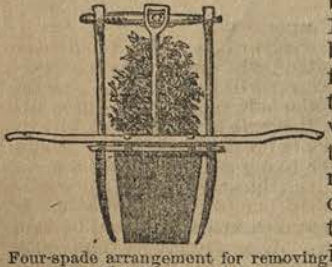
ing water. When the disk of earth inclosing the soil has been frozen into a solid mass, it may be pried up without disturbing the roots, and the whole removed to a new site with no greater difficulties than those encountered in handling without injury. This method is, of course, not adapted to general planting, but is limited to special cases, where the distance is not great, and the circumstances are favorable.

It is the practice of some to carefully pass under the ball when a little raised, a sheet of stout coarse canvas, which is then bound firmly with ropes around the roots and the included soil to keep the small fibers from the air, and the native soil as much as possible in contact.

Carrière[1] recommends surrounding the ball of earth (which should be smaller below than above), with hurdles, branches of trees, boards, or simply layers of straw, strongly binding with cords. It would be still better in some cases, to have a basket-work woven for this use, by a basket-maker, so as to fit the ball, and of strength proportioned to need. The bark of the tree should be securely wrapped, wherever ropes are to be fastened or force applied. In raising very large trees, three poles or pieces of timber, fastened together at the top, would give support to the pulleys used for hoisting it high enough for placing upon vehicle. The hole to receive the tree should of course be suited in form and depth, and the sides should be loosened with a pick, after the tree is placed, as they would be apt to become hard-pressed in the operation. The packing is then carefully removed, the tree suitably supported, rich soil is carefully filled in, a thorough watering is applied, and the ground covered with litter to prevent drying. With respect to the season when this should be done, Carrière, writing for the practice in France (comparable with the middle latitudes of the United States), says:[2]

> We should as much as possible execute these labors in winter, when there is no snow, and the ground not too wet, because, aside from the facility with which it can be done, the transportation is favored by the ice, which affords a better chance of success. When the ball is prepared and wet the night before, freezing will turn the whole into a solid mass, which can be moved with great certainty, and when the tree is not extremely large often without coverings for the roots. It is moreover evident that this operation should not be tried unless the tree is hardy, and that it should never be attempted where the roots might be injured by the frost.

A simple contrivance, consisting of four spades, a frame for holding them together, and cross-bars for spreading the handles, was described by Mr. MacGlashen, in the *Revue Horticole*, 1853, p. 455, and is worthy of notice. It can best be illustrated by an engraving. A square frame being placed on the ground around the tree or plant to be moved, four spades, with holes in the handles, are pressed vertically down, and their handles spread as much as possible apart, and fastened on the cross-bars by pins. The projecting ends of the square frame serve as handles for raising and carrying the plant and compressed soil inclosed between the blades of the spades, with very slight disturbance of the roots.[3]



Four-spade arrangement for removing the soil with roots of trees.

[1] *Pépinières*, p. 118.
[2] *Ib.*, 122.
[3] This device works extremely well in cases where the tree is small, but in models that have been made for those of larger size, with eight spades of proper size and strength, two on each side of the square, the expense and inconvenience become greater than the advantages. In large models that have been made, the handles of the spades were long and solid, bound with iron rings at the end, so as to bear driv-

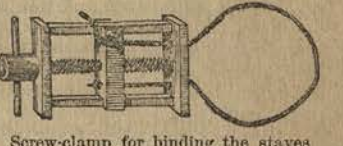
It is needless to remark that in the transplanting of deciduous trees, the removal should be done during the suspension of active vegetation, that is, from October to April, and generally in the spring before the leaves begin to appear. The pits for receiving the trees should be dug a little time before, if the soil is good, and several months before, if of inferior quality; and it always tends to secure success in poor soils to place an abundance of fertile vegetable mold.[1]

---

ing deep into the soil, and movable sockets were placed to receive the pressure of screws for spreading apart the tops of the spade-handles. If too large to be carried by men, the apparatus was mounted upon wheels, with a windlass for lifting and supporting it by chains. The machine, consisting of four spades, is most effectual in its simplest form, and for small trees. Its application becomes more difficult as the size of the trees becomes larger, and very soon reaches the maximum limit of application, because large trees must have a much wider ball of earth than it can raise, and in stony soils it is altogether useless in any form, and if the soil approaches the condition of dry sand, the contents would more or less escape, notwithstanding the compression.

Another method is here shown, which needs no explanation beyond that afforded by the engravings. It is adopted in the city of Paris for the removal of evergreen trees, which are taken from the Bois de Boulogne and Vincennes. In first placing the staves, a space of three-fourths of an inch is allowed between each, so as to admit of some compression without bringing them in contact. When fully compressed, barrel-hoops are put around and nailed, so that the roots are inclosed, as it were, in a cask, and the whole may be raised and carried without the least risk of injury to the growing tree. This cut is reduced from one in Kirwan's *Coniferæ*, where it is credited to an article by M. André, in the journal *La Ferme*.

Mode of transplanting practiced in the nurseries near Paris.



Screw-clamp for binding the staves around the soil.

[1] M. Dupuis, in writing for the conditions found in France, says:

"In general, in a northern climate we would find it of advantage to dig the holes in autumn for the trees that are to be set at the end of winter. The dimensions will vary, but for trees of mean size two meters square and one deep will be sufficient. In this operation we should put separately on three sides of the hole the turf, the first mellow soil, and the earth from the bottom. Sometimes the hole is dug round, but the operation is not so easy, and it should be reserved for rare or precious kinds that need to be planted separately. In setting avenues, some prefer to dig a trench about a meter in width, dividing the earth into two parts and placing it on the two sides. In dry soils, warm climates, and for rustic deciduous trees, autumnal planting is preferable. In humid soils, in cold climates, and for the delicate or evergreen kinds, it should be done toward the close of winter or at the beginning of spring. When the proper time comes the tree should be raised with care, so as to preserve as many of the roots as possible, and it should be carried to the place it is to occupy with as little exposure of the roots to drying as possible. The ends of the roots should be smoothly cut where mutilated, and we should at the same time suppress some of the lateral branches—sparing the head if possible.

"In proceeding to plant, we begin by spreading over the bottom of the hole several inches of the upper soil. The tree is then set upright and the roots are spread apart, so as to lie in a natural position, and the rest of the surface soil is scattered in. When good soil can be got, especially such as is thrown out in the cleaning of ditches or water-courses, it would be well to spread this in the bottom of the hole. The middle layer of soil is then scattered in, the tree being lightly moved up and down in a ver-

From time immemorial, it has been known that good results will often be obtained without the slightest intervention of man, as we observe in our native forests; but it is equally certain that, by judicious trimming and timely attention to defects in growth, a much more uniform and profitable result may be obtained and needless losses avoided.

This attention is more especially desirable in the case of ornamental planting, in which generally more time and expense can be afforded than in the larger way, where whole forests require attention, and the cost of labor is an item that must be carefully regulated, so as to be kept within the limits allowable in the general result.

Nothing is more common than to find in forest trees great injuries to timber in the form of rotten cavities, often extending to the root, which began by the breaking or cutting off of large branches, or that have been caused by a dead branch remaining on until it finally drops, leaving a pipe for admitting the rains into the heart of the tree, and finally destroying it altogether. The stages of this process are well exhibited in the following illustrations:

At first. *In 5 years.* *In 10 years.* *In 15 years.*

Stages of decay in a branch of Oak partly left in trimming.

The loose knots in sawed timber, afford familiar examples of the injuries that may follow when limbs remain upon the tree after they are dead, and wherever woodlands receive proper attention these cases require the notice of the forester, and become real subjects of surgery.

The principal objectof forestry being to raise the largest amount of wood of the greatest value upon a given area of land, it becomes important not only to give attention to such accidents and injuries as may happen, but to prevent at times a tendency to vicious growth, or the formation of large branches too near the ground, and especially in trees planted for ornament, where symmetry of form is an object worthy of attention, and may be secured by a little timely care. In young trees the growth may sometimes be thrown into particular branches by cutting off the ends of others, still leaving the principal foliage for the use of the tree, and without sensibly checking its general growth. When large branches are cut or sawed first on the upper side, they are apt to tear down the bark and wood on the under side when they fall. The cutting should therefore be commenced below, as shown in the annexed cut, in which the incision A is first made, and afterward that at B. When finished, the incision should be perfectly smooth, and as vertical as may be. Such a surface will heal over much better than a rough one, and the soundness of the wood at the place of amputation may be secured by a coat of paint or coal-tar, until the injury is repaired. It is true that the new wood will not unite with the old, but

A well-healed and a badly-healed wound in timber.

to take its place. A branch too much inclined from a proper direction may be drawn up by tying to other branches, just as the whole tree in a young orchard, is often corrected from a leaning tendency by tying to stakes. If a cord is not at hand the forester sometimes uses a small branch still attached to the tree as a wythe for tying up a leaning top or irregular branch until it will keep in place without help. These methods are shown in the annexed engravings.[1]

These attentions to details, always important, are too generally neglected, and may be not practicable with us in the case of forests; but sometimes a little reasonable care will, if timely bestowed, prevent a valuable tree from becoming good for nothing.

After trimming the lower branches of a tree, it will be often found that shoots will start out from the edges of the wound, or in other places, which will sometimes, if allowed to remain, take inordinate growth. If not desired, they should be removed by preference the second or third year in August or September, after the wood of the year has been formed.[2] For this purpose various instruments have been de-

[1] A careful attention to the condition of an old tree is not less useful than in the young, the chief anxiety in this case, being to remove dead or dying branches or rotting parts with as little injury as possible, and to protect the wood until it can heal, or if this be hopeless, to exclude air and moisture, and thus prevent or retard further decay. Where a section is too large to admit the hope that it will ever grow over, the life of a tree may be sometimes prolonged by covering the exposed wood with a disk of lead, zinc, or tin, carefully secured around the edges, so as to exclude the air and moisture. In some cases aged trees in parks and private grounds, which are valued on account of historical or family associations, may thus be preserved, and their vigor in some degree renewed.

Whenever a piece of bark has been removed down to the sap-wood, the adhesion cannot be restored, however carefully replaced, and the part exposed loses its vitality, and if left unprotected, tends sooner or later to decay. The living parts adjacent will begin to form new wood, and if the injury be not extensive, they will eventually close over the wound, and in course of time leave no external trace. But if large, the exposed wood tends to decay, and before it has had time to close, a rotten cavity is formed, extending somewhat upward, but chiefly downward in the direction of the vessels of the wood, and sometimes quite into the root.

Although no application, however soon applied, will supply the place of the natural covering, a coat of coal-tar or other paint would afford great protection, and often prevent the rotten cavity from forming, until the wood had united over the injured part.

Whenever the bark is loosened, the wood dies under the affected part, the same as though it had been wholly removed, and it is not unfrequently found in orchards and plantations that this loosening of bark has existed for some time without notice, causing a languishing appearance without visible cause. The healing process by overgrowth goes on in such cases as when fully exposed, and the treatment needed is the removal of the dead bark and protection as in case of other wounds.

Such exposed places and rotten cavities are further injurious by harboring insects, and especially those whose larvæ feed upon decaying wood, and through whose agency the destroying process is hastened. The remedy, so far as known, consists in cleaning out the decayed part as fully as possible, applying coal-tar, or other covering, freely to the surface, and, where it is possible, plugging up the orifice with hard wooden wedges or pins, which should be cut close, and be allowed to grow over. Such cavities, if too large for this treatment, may, in old trees, be sometimes hindered from growing larger, by closing them with carefully fitted planks or metal sheets, so as to exclude the air. The borers that infest dead wood might not respect a plank or board which has already lost its vitality, but a sheet of zinc or other metal would afford complete immunity from their attack.

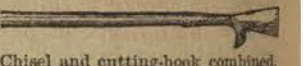
[2] The side branches that spring out where an oak forest is thinned, and the trunks exposed to light, would, if allowed to grow, interrupt the balance of growth, and cause the top to die out. The rule laid down by Lorentz and Parade is, that the pruning of this side-growth should commonly begin three years after the thinning, and be repeated every three years to about half or two-thirds the period of revolution. By this time the younger growth will have come up high enough to hinder further trouble from these branches along the trunk.—*Culture des Bois*, 2d ed., p. 299.

vised for cutting by a stroke or by a cutting edge, on the plan of a chisel, or by a drawing cut, as in a bill-hook, or between cutting-blades, as in the shears, or by a fine-toothed saw. These, except the first, may sometimes be fastened to long handles to great advantage.

The following cuts represent some of these implements as given in French works. The *serpe* is a heavy cutting tool, usually carried in a sheath on the left side, supported by a strap passing over the right shoulder. In using this tool, the blow should be made from below upward:

Long-handled shears for pruning (French pattern).

Pruning-chisel.



Chisel and cutting-hook combined.

It is essentially important that the cutting-shears should have a convex and a concave blade,

Hand-shears.

The serpe.

and they work to best advantage when the branch is bent at the moment of cutting, so that the parts may yield as they are separated. The facility with which a branch of green wood an inch and even two inches in diameter may be cut by these shears, when properly managed, is surprising.

With respect to the season of the year when trimming may be done to best advantage, authorities agree quite generally in designating the beginning of autumn, while the days are still pleasant and long, and the condition of growth is least favorable for reproduction. Many kinds of trees would suffer from the bleeding of sap if trimmed late in winter or in spring, and the growth of sprouts around the wound would be troublesome. The action of frost on a fresh wound, in some climates, tends to cause decay, and indicates the winter season as improper for this labor.[1] Where oak timber is grown for use in naval architecture, attention is often given to the future uses of the parts, by encouraging the growth of curved limbs, and sometimes by bending and confining certain branches until they will retain the particular shape desired.[2] This has been done to some extent in forests owned and managed by governments, with the view of supplying the wants of their ship-yards.

In Europe, the wood obtained from trimming trees, more than covers

[1] The *Count des Cars*, whose method of pruning will be more fully noticed on a subsequent page, after mentioning the relative advantages of the different seasons for pruning forest-trees, remarks: "In conclusion, I would say that as for the trees themselves the season of year is of little consequence; the main thing is to trim. But I would advise as a general rule, for woods of considerable extent, to do it from autumn to spring, or from September to June, if you do not work through the year. In some mountainous countries, and generally in France, they trim through the winter, and the work can generally be done except when it rains or snows, or when frosty and icy. At other times the work can always be done to advantage. In the morning, when the branches are slippery, the workmen work from their ladders upon the large branches, rotten spots, and the like, which require most time, and in warm, pleasant weather, on a calm day, they may climb among the branches of the top."—*L'Elagage des Arbres*, p. 82.

[2] Upon this subject, the *Manuel de l'Elageur* of M. Hotten and the writings of Du Hamel du Monceau may be consulted with great advantage. It is observed that the oak seldom bears trimming well, and it is laid down by M. Nanquette as a rule, that it should only be done when found necessary to improve its form, or to prevent the injuries to which it is exposed. Among these is the suppression of gormand branches after thinning and before the undergrowth has come up high enough to shade them out. The lopping off of these branches should be done at the end of the summer, and one or two years after if necessary.—*Exploitation, Debit et Estimation des Bois*, pp. 8–10.

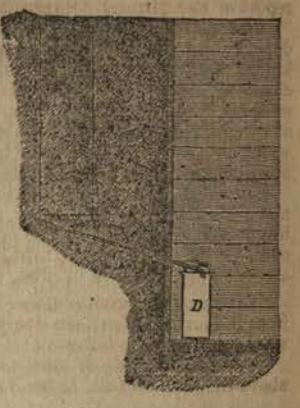
A, in the accompanying figure. This vessel is filled with earth taken from near the place where the observations are to be made. The depth from the surface to the false bottom is that at which the observation is proposed to be made. The lower bottom is funnel-shaped, and is connected with a leaden pipe, through which the water flows into a receiving vessel (D.), for measuring, from time to time. To accomplish this, a pit is dug, 10 feet long, 6 feet wide, and 5 feet deep, and into this the discharge-pipes from the instruments, at several depths, are brought. Such an instrument is called a *Lysimeter*. If the surfaces of some of these are covered with moss, leaves, humus, turf, &c., while others are left with bare earth, the influence of these coverings upon the percolation of water may be determined. This instrument should at first have the surface of the earth within it a little higher than the ground, so as to allow settling, and it should be left some months undisturbed before beginning observations, so as to allow the contents to get compacted, as occurs naturally in the soil. From this we get data for learning the amount of water that penetrates the soil and reaches springs. If we deduct the amount collected from the rain-fall, we get the amount evaporated, lost, or absorbed by vegetation.

Lysimeter.



4. THE EVAPORATION METER (atmometer) determines the daily and yearly amount of water returned to the air by evaporation. Comparisons of the amount of evaporation and of rain-fall will show, in certain localities, that more water is evaporated than falls in rain, &c. The instruments should be freely exposed to the winds, but should be sheltered from rains, snows, and the direct rays of the sun. Lamont's atmometer, shown in the annexed engraving, consists of three principal parts, a water-reservoir, *a*, *b*, *c*, *d*, an evaporating-bowl, *f*, *g*, *h*, and a connecting tube, *R R*. A piston, passing through an air-tight packing, is so arranged that it may be pressed down into the reservoir or raised by the screw *S*, and an index, *n*, attached to this, points to the degrees on a graduated scale, *s s*. This scale may be raised or lowered, so that its zero point is opposite the index point *n*, when the instrument is set at the beginning of an observation. The mode of operation and of reading are as follows: The piston is drawn up, and rain-water is poured in at the bowl till it stands at the point *A*. The reservoir being full of water, the scale is set so that the index points to zero, and the piston is then pressed down, so that the water in the bowl is forced up so as to stand level with a line *M. N.* marked on the inner side just below the rim. When an observation is made, some time after, the piston is raised and all the water in the bowl is drawn in until it stands just level with the opening *A*. If there had been no loss, the index would then point at zero; but, as more or less evaporation has taken place, the difference is at once shown by the index on the scale. More water is added, if necessary, the scale is again set, and the water pressed up to the mark near the rim of the bowl, as before, and left till next observation. The bowl having a much greater sectional area than the reservoir, the graduation of the scale is enlarged in corresponding degree, as compared with the depth actually evaporated if measured in the bowl itself. The scales used were graduated to tenths of Paris lines, and the reading by estimation could be had for smaller distances.

Lamont's Atmometer.

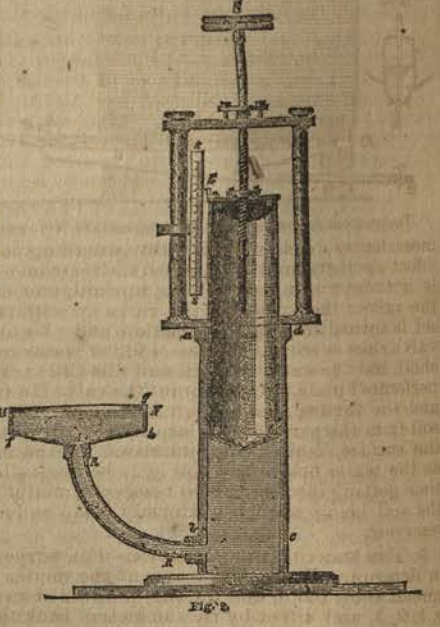


Fig. 2.

The instrument is placed upon a stand about 5½ feet above the ground, freely exposed

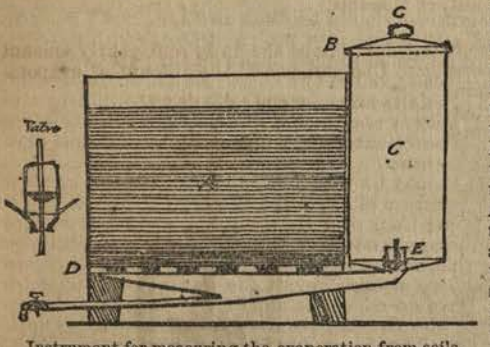
to the air, but sheltered from the sun and from rains, and is adjusted to a level. The evaporating bowl has an area of one Paris square foot, and is about three inches deep. Observations cannot be made when the temperature is below the freezing point. Full details of the arrangement and use of this instrument were first given in the weekly report of the Munich Observatory, No. 158, 1868.

[Before this instrument was introduced, a simpler form of apparatus was used for determining the amount of evaporation. It consisted of a broad shallow zinc vessel, of known area, deepest in the middle, where it was connected with a discharge-pipe, closed by a cock. Being filled by a measured quantity of water, it was exposed to the open air, and the water drawn off and measured, from time to time, gave the amount of evaporation. A still simpler form was a shallow pan, of known area, filled with water and weighed from time to time, or supported by a spiral spring, which gradually arose, carrying an index, as the weight became less.]

These instruments, in whatever form, give very different results, according to the material of which the pan is made. If of metal, it may become warm in greater or less degree, according to the conducting power of the metal used. This result, however, becomes less important, where all the instruments used in the comparative observations are alike in area, material, and exposure.

EVAPORATION FROM SOILS.—The instrument for showing the amount of evaporation from the surface of soils entirely bare, or covered with wood-litter, moss, or leaves, &c., was constructed as follows:

A box, A, is made of zinc, one Paris foot square, and 8 inches deep. At 2 inches above the real bottom there is placed a perforated plate. An open cylindrical zinc vessel, B C, is connected with the box by a tube. Into this there is slid another vessel, C, a little smaller, which is closed at the top, and is furnished with a valve at the bottom, opening upward and attached to a spindle, as shown by the enlarged figure. When in position, this valve should stand level with the perforated bottom of the box. A thin mat of straw is first laid over the perforated bottom, and the box is then filled with the same kind of soil as that which is found at the station, either left with the surface bare or covered with moss, leaves, or other substances, according as it is desired to measure their effect upon evaporation. When the instrument is used the closed vessel, C, is withdrawn, turned bottom upward, and filled through the opening at the valve; then, drawing the valve up with the fingers to close it, the vessel is turned into proper position and placed in the open cylinder. The valve rises as soon as the vessel full of water touches the bottom of the outer shell, and the water flows in and fills the vacant space below and up to the perforated plate. At this point the valve closes by the pressure of the water, and the further access of air is stopped. The water will rise through the soil from the perforated plate by capillary attraction and evaporate from the surface, more being admitted by the automatic action of the valve as the water below the soil gets below its level, a little air at the same time getting into the closed reservoir; and it will thus continue to operate, the soil being always uniformly damp as long as any water is left in the reservoir.



Instrument for measuring the evaporation from soils.

Earth Thermometer.

5. THE EARTH THERMOMETER.—For purposes of forestry, it is sufficient to determine the temperatures at the depths to which roots penetrate and spread their roots, and for this purpose observations are made at depths of ½, 1, 2, 3, and 4 feet by thermometers sunk to those depths,[1] and arranged so that they may be easily withdrawn for observation.

[1] In some cases thermometers, with stems several feet long, have been placed in the earth, which allowed of readings without withdrawing them from the soil. The instruments used at the Bavarian stations are the same as described by Dr. V. Lamont, in No. 19 of the Weekly Report of the Royal Observatory (Munich), and in the fourth supplementary volume of the Annals of the Munich Observatory, p. 91, plate iv. They differ from common thermometers by having the mercury in the bulb surrounded by thick glass, which, being a slow conductor of heat, will not allow sensible changes to occur when the thermometers are drawn up for observation.
